

Q1. What is the difference between 'Paste' and 'Paste Special' in Excel? Briefly explain with examples.

Sol.

1. **Paste** – It inserts everything exactly as copied.

What it pastes:

- Values
- Formulas
- Formatting (font, color, borders)
- Comments, data validation, etc.

Example:

- Cell A1 contains $=B1+C1$ with yellow fill.
- Copy A1 → Paste in A2
→ A2 will also contain the formula $=B2+C2$ and the same yellow formatting.

2. **Paste Special** – Paste Special lets you choose *specific components* of the copied data.

Common options with examples:

- **Values**
Paste only the result, not the formula.
 - $=B1+C1$ → Paste Special → Values
→ Only the number (e.g., 50) is pasted.
- **Formulas**
Paste only the formula, without formatting.
- **Formats**
Paste only formatting (colors, fonts, borders).
- **Transpose**
Convert rows into columns or columns into rows.
- **Multiply / Add / Subtract / Divide**
Perform calculations while pasting.

Example:

- Copy cells with formulas → Paste Special → Values
→ Useful when sharing data or locking results.

Q2. Describe the functions and usefulness of 'Freeze Panes' and 'Split Panes' in Excel.

Sol.

Freeze Panes -

Function: Freeze Panes locks selected rows and/or columns so they remain visible while you scroll through the worksheet.

Usefulness:

- Keeps headers or key identifiers visible in large datasets
- Improves readability and data analysis
- Prevents losing context when scrolling

Example:

- Freezing the top row keeps column headings visible while scrolling down.
- Freezing the first column keeps row labels visible while scrolling right.

Split Panes -

Function: Split Panes divides the worksheet window into two or four separate panes, each with its own scroll bar.

Usefulness:

- Allows viewing and working on different parts of the same worksheet simultaneously
- Useful for comparing data from distant rows or columns
- Helps analyse large worksheets without switching views

Example:

- Splitting vertically lets you view column A and column Z at the same time.
- Splitting horizontally lets you compare top and bottom sections of a sheet.

Q3. Explain the difference between inserting a new row and inserting a new column in Excel. Can you insert multiple rows or columns at once?

Sol.

Inserting a New Row

- Adds a horizontal row to the worksheet.

- The new row is inserted above the selected row.
- Existing rows below shift downward.
- Used when you want to add more records or entries.

Example:

If you select row 5 and insert a row, the new row becomes row 5 and the original row 5 moves to row 6.

Inserting a New Column

- Adds a vertical column to the worksheet.
- The new column is inserted to the left of the selected column.
- Existing columns to the right shift rightward.
- Used when you want to add a new field or attribute.

Example:

If you select column C and insert a column, the new column becomes column C and the original column C shifts to column D.

Inserting Multiple Rows or Columns at Once –

Yes, you can insert multiple rows or columns at the same time.

How:

- Select multiple rows (or columns) equal to the number you want to insert.
- Right-click → Insert, or use Home → Insert → Insert Sheet Rows/Columns.

Example:

- Selecting 3 rows and inserting will add 3 new rows at once.
- Selecting columns B to D and inserting will add 3 new columns together.

Q4. What are logical functions in Excel? Provide examples of at least two logical functions and their applications.

Sol.

Logical Functions in Excel

Logical functions in Excel are used to test conditions and return results based on whether the condition is TRUE or FALSE. They help in decision-making and automate calculations based on criteria.

i) IF Function

Purpose:

Checks a condition and returns one value if the condition is TRUE, and another value if it is FALSE.

Syntax:

=IF(logical_test, value_if_true, value_if_false)

Example & Application:

- **Formula:**

=IF(A1>=40, "Pass", "Fail")

- **Application:**

Used in result sheets to determine whether a student has passed or failed based on marks.

ii) AND Function

Purpose:

Returns TRUE if all conditions are TRUE; otherwise returns FALSE.

Syntax:

=AND(condition1, condition2, ...)

Example & Application:

- **Formula:**

=AND(A1>=40, B1>=40)

- **Application:**

Checks whether a student has passed in all subjects.

iii) OR Function (Additional Example)

Purpose:

Returns TRUE if any one of the conditions is TRUE.

Example:

=OR(A1="Yes", B1="Yes")

Application:

Used to check eligibility if at least one criterion is satisfied.

Q5. Discuss the purpose of 'XLOOKUP' and how it differs from the traditional 'VLOOKUP' function.

Sol.

Purpose of XLOOKUP

XLOOKUP is a modern lookup function in Excel used to search for a value in a range or array and return a corresponding value from another range. It is designed to replace older lookup functions like VLOOKUP, HLOOKUP, and even many uses of INDEX - MATCH.

Basic syntax:

=XLOOKUP(lookup_value, lookup_array, return_array, [if_not_found], [match_mode], [search_mode])

How XLOOKUP Differs from VLOOKUP –

Aspect	XLOOKUP	VLOOKUP
Lookup direction	Can look left or right	Can look only to the right
Column index required	No column number needed	Requires column index number
Exact match	Default behavior	Must specify FALSE
Handling not found values	Built-in if_not_found argument	Requires IFERROR
Search direction	Can search top-to-bottom or bottom-to-top	Top-to-bottom only
Range changes	Safer (no break if columns inserted)	Can break if columns are added/deleted
Ease of use	More flexible and readable	More rigid

Example Comparison

Using VLOOKUP:

=VLOOKUP(A2, A2:D10, 3, FALSE)

- Looks for value in column A
- Returns data from the 3rd column
- Breaks if column positions change

Using XLOOKUP:

=XLOOKUP(A2, A2:A10, C2:C10, "Not Found")

- Clearly defines lookup and return ranges
- Works even if columns move
- Returns a custom message if not found

Key Advantages of XLOOKUP

- More flexible and robust
- Easier to read and maintain
- Eliminates common VLOOKUP limitations
- Works as a powerful replacement for multiple lookup functions

Q6. Create a worksheet titled 'Employee Data' with columns: Name, Age, Department. Add 5 rows of data.

Format as follows:

- Bold and center-align the header row
- Apply a fill color
- Auto-fit column width

(Include a screenshot showing your formatted table.)

Sol. Please find below screenshot -

A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T
1	Name	Age	Department																
2	Ravi Saxena	30	BI																
3	Atul Negi	32	Marketing																
4	Manpreet Singh	28	HR																
5	Ashish sharma	29	Finance																
6	Yogesh Singh	34	BI																
7																			
8																			
9																			
10

12																			
13																			
14																			
15																			
16																			
17																			
18																			
19																			
20																			
21																			

Q7. Demonstrate how to insert and delete multiple rows and columns in Excel.

(Provide screenshots before and after the changes.)

Sol. Please find below screenshot for inserting multiple rows and columns –

Rows –

Screenshot before inserting multiple rows –

A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T
1	Name	Age	Department																
2	Ravi Saxena	30	BI																
3	Atul Negi	32	Marketing																
4	Manpreet Singh	28	HR

Screenshot after inserting multiple rows –

Columns -

Screenshot before inserting multiple columns –

Screenshot after inserting multiple columns -

Q8. Use Excel's 'Find and Replace' feature to update department names in a sample table.

(Include a screenshot showing the replaced data.)

Sol. Screenshot before replacing department –

The screenshot shows an Excel spreadsheet titled 'Emp ID' with data in columns A, B, C, and D. The 'Department' column contains values like BI, Marketing, HR, Finance, and BI. An open 'Find and Replace' dialog box is centered over the spreadsheet. The 'Replace' tab is active. In the 'Find what:' field, 'Marketing' is typed. In the 'Replace with:' field, 'Data Science' is typed. The 'Replace All' button at the bottom left of the dialog box is highlighted with a blue border.

Screenshot after replacing department –

The screenshot shows the same Excel spreadsheet and 'Find and Replace' dialog box as the previous image, but the dialog box now displays a message: 'All done. We made 1 replacements.' with an 'OK' button. This indicates that the replacement process has been completed.

Q9. Create a small numerical dataset and apply the following functions:

- **AVERAGE**
- **MAX**
- **MIN**

(Include a screenshot showing the formulas and their results.)

Sol. Screenshot of result -

The screenshot shows a Microsoft Excel spreadsheet titled "Assignment...". The ribbon is visible at the top with tabs like File, Home, Insert, Page Layout, Formulas, Data, Review, View, and Auto. The "Home" tab is selected. The font and alignment groups are visible on the ribbon. The formula bar shows the formula =AVERAGE(C3:F7) entered into cell D10. The main table is titled "Sale Report" and has columns for Emp ID, Name, East Zone, West Zone, South Zone, and North Zone. Rows 3 through 7 contain data for employees 101 to 105. Row 10 contains summary calculations: Average Sale (77.9), Maximum Sale (100), and Minimum Sale (43). The table and summary row are highlighted with green borders.

Sale Report					
Emp ID	Name	East Zone	West Zone	South Zone	North Zone
101	Ravi Saxena	43	53	97	93
102	Atul Negi	88	73	81	97
103	Manpreet Singh	100	100	73	50
104	Ashish sharma	97	52	50	51
105	Yogesh Singh	70	96	100	94

Average Sale	=AVERAGE(C3:F7)
Maximum Sale	100
Minimum Sale	43

Screenshot of formulas -

i) Average -

This screenshot shows the same Excel spreadsheet as the previous one, but the formula =AVERAGE(C3:F7) is now explicitly entered into the formula bar under the "SUM" dropdown. The table and summary row are highlighted with green borders. The formula bar also shows the formula =AVERAGE(C3:F7) entered into cell D10.

Sale Report					
Emp ID	Name	East Zone	West Zone	South Zone	North Zone
101	Ravi Saxena	43	53	97	93
102	Atul Negi	88	73	81	97
103	Manpreet Singh	100	100	73	50
104	Ashish sharma	97	52	50	51
105	Yogesh Singh	70	96	100	94

Average Sale	=AVERAGE(C3:F7)
Maximum Sale	100
Minimum Sale	43

ii) Maximum -

Screenshot of Microsoft Excel showing a Sale Report table and formulas for Maximum Sale.

The table has columns: Emp ID, Name, East Zone, West Zone, South Zone, North Zone.

Row 10 contains: Average Sale (77.9), Maximum Sale (=MAX(C3:F7)), Minimum Sale (43).

	A	B	C	D	E	F
1	Sale Report					
2	Emp ID	Name	East Zone	West Zone	South Zone	North Zone
3	101	Ravi Saxena	43	53	97	93
4	102	Atul Negi	88	73	81	97
5	103	Manpreet Singh	100	100	73	50
6	104	Ashish sharma	97	52	50	51
7	105	Yogesh Singh	70	96	100	94
8						
9						
10		Average Sale		77.9		
11		Maximum Sale	=MAX(C3:F7)			
12		Minimum Sale		43		
13						

iii) Minimum -

Screenshot of Microsoft Excel showing a Sale Report table and formulas for Minimum Sale.

The table has columns: Emp ID, Name, East Zone, West Zone, South Zone, North Zone.

Row 10 contains: Average Sale (77.9), Maximum Sale (100), Minimum Sale (=MIN(C3:F7)).

	A	B	C	D	E	F
1	Sale Report					
2	Emp ID	Name	East Zone	West Zone	South Zone	North Zone
3	101	Ravi Saxena	43	53	97	93
4	102	Atul Negi	88	73	81	97
5	103	Manpreet Singh	100	100	73	50
6	104	Ashish sharma	97	52	50	51
7	105	Yogesh Singh	70	96	100	94
8						
9						
10		Average Sale		77.9		
11		Maximum Sale		100		
12		Minimum Sale	=MIN(C3:F7)			
13						

Q10. You're working with a dataset that contains missing values. As a Data Scientist, explain how you'd detect and handle missing data using Excel. Mention tools like:

- Go To Special
- ISBLANK
- COUNTBLANK

(Include a screenshot showing how blanks are identified or processed.)

Sol. In Excel, I would detect and manage missing values using the following tools and functions:

i) Detecting Missing Data in Excel

- Go To Special (Blanks) – Purpose: Quickly locate all blank cells in a dataset.

Steps:

1. Select the entire dataset
2. Press **Ctrl + G** → Click **Special**
3. Choose **Blanks** → Click **OK**

Use case:

All blank cells get selected at once, making it easy to:

- Highlight missing values
- Delete rows/columns
- Enter a default value (e.g., 0 or “Not Available”)

Screenshot –

The screenshot shows the Microsoft Excel ribbon with the Home tab selected. A table with columns A through D and rows 1 through 14 is displayed. Row 1 contains the header "Emp ID". Rows 2 through 11 contain values 101, 102, 103, 105, 107, 108, and 110 respectively. Row 12 is empty. A green selection box highlights the range from A1 to A11. A context menu is open over the empty cell at A12, showing options like Paste, Insert, Delete, etc. A 'Go To Special' dialog box is overlaid on the ribbon, with the 'Blanks!' option selected under the 'Select' section. Other options like 'Numbers', 'Text', and 'Errors' are also checked.

The screenshot shows the same Excel interface as the first one, but now the cell A5 is highlighted in green, indicating it is selected. The value '105' is displayed in cell A5. The rest of the table and the green selection box from the previous screenshot remain the same.

▪ ISBLANK Function

Purpose: Check whether a specific cell is empty.

Syntax: =ISBLANK(A2)

Output:

- TRUE → Cell is blank
- FALSE → Cell contains data

Screenshot -

The screenshot shows a Microsoft Excel spreadsheet with the Home tab selected in the ribbon. The formula bar displays '=ISBLANK(A5)'. The spreadsheet contains the following data:

	A	B	C
1	Emp ID		
2	101	FALSE	
3	102	FALSE	
4	103	FALSE	
5	105	=ISBLANK(A5)	
6		FALSE	
7		TRUE	
8	107	FALSE	
9	108	FALSE	
10		TRUE	
11	110	FALSE	

- COUNTBLANK Function

Purpose: Count how many blank cells exist in a range.

Syntax : =COUNTBLANK(B2:B10)

Use case:

Helps quantify missing data before deciding whether to:

- Remove rows
- Replace values
- Ignore the column entirely

Screenshot -

The screenshot shows a Microsoft Excel spreadsheet with the following details:

- Clipboard:** Contains "Paste", "Cut", "Copy", and "Format Painter".
- Font:** Set to "Calibri" in bold.
- Formula Bar:** Shows the formula `=COUNTBLANK(A2:A11)`.
- Table:** A 12x4 grid of cells labeled A through D and 1 through 12. Column A contains "Emp ID" and values 101 through 110. Column B contains the formula `=COUNTBLANK(A2:A11)`. Cells A11 and B11 are highlighted with blue borders.

ii) Handling Missing Data

Once detected, I may:

- Remove rows/columns if missing data is minimal
- Impute values (mean/median for numerical data, mode for categorical data)
- Flag missing data using helper columns for further analysis
